Shaft Coupling Introduction

Introduction

Rigid Shaft Couplings

	Nominal torques T_{KN} [Nm]	Torque load			Transmission of torque	
		uniform	not uniform	shocks, very rough operation	backlash-free	overload holding / fail safe
Tru-Line Flange-Couplings						
RFK ... TBO with backlash-free cone clamping connection	2 500 - 625 000	●●	●●	●●	●●	

Cone Clamping Couplings

RWK ... EEO with backlash-free connection of two shaft ends	130 - 7 600	●●	●●	●●	●●	
---	-------------	----	----	----	----	--

Torsionally Rigid Shaft Couplings

	Nominal torques T_{KN} [Nm]	Torque load			Transmission of torque	
		uniform	not uniform	shocks, very rough operation	backlash-free	overload holding / fail safe

Gear Couplings

RDZ ... DTO with double engagement gearing	1 330 - 391 500	●●	●●	●●		
RDZ ... DFO with single engagement gearing	1 330 - 391 500	●●	●●	●●		
RDZ ... EEO with continuous sleeve, double engagement gearing	10 - 380	●●	●●	●		

Disc Couplings

RDL ... DSO with single disc pack	96 - 18 700	●●	●●	●●	●●	
RDL ... DSZ with double disc packs with spacer	96 - 18 700	●●	●●	●●	●●	
RDL ... DSA with double disc packs, design according to API 610	96 - 18 700	●●	●●	●●	●●	

Flexible Couplings

RDA ... ESO with keyway	2 - 8 000	●●	●●	●		
RDA ... ESO with backlash-free clamping connection	2 - 32	●●	●●	●		
RDA ... ESO with mounting flange with through bores	85 - 8 000	●●	●●	●		

RDA ... ESO - Combination of hub designs

RDA ... ESO - Example hub combination

Elastic Shaft Couplings

	Nominal torques T_{KN} [Nm]	Torque load			Transmission of torque	
		uniform	not uniform	shocks, very rough operation	backlash-free	overload holding / fail safe

Grid Couplings

RES ... EYO with horizontally split cover	48 - 335 500	●●	●●	●●		
RES ... ETO with vertically split cover	48 - 169 000	●●	●●	●●		

Pin and Bush Couplings

REB ... DCO	95 - 1 299 500	●●	●●	●●		●●
REB ... DCS	2050 - 112 000	●●	●●	●●		●●

Jaw Couplings

REK ... DGO with enclosed elastic elements	34 - 7 000	●●	●●	●●		●●
REK ... DHO with enclosed elastic elements and two piece hub	160 - 7 000	●●	●●	●●		●●
REK ... DGZ with enclosed elastic elements and spacer	60 - 7 000	●●	●●	●●		●●
REK ... DCO with curved jaws	9,6 - 4 514	●●	●●	●●		●●
REK ... DCS with curved jaws	181 - 4 514	●●	●●	●●		●●

Introduction

Couplings by RINGSPANN

For over 60 years, RINGSPANN has been renowned as a provider of couplings, beginning with the patented L-coupling from 1956, which is still offered today as model RDA ... ESO. Back then RINGSPANN was able to offer drive system engineers a compact, torsionally rigid flexible coupling based on the Oldham principle that can compensate large parallel and angular misalignments in small spaces.

RINGSPANN has since expanded its coupling range and can now offer the couplings for almost all applications.

For example, the rigid Tru-Line Flange-Couplings of the RFK ... TBO model with a special Shaft-Hub-Connection allows for freely hanging motor gear units with a torque support to be coupled to conveyor belt pulleys without fretting corrosion while accommodating significant rotating bending moment stress.

RINGSPANN offers equally suitable couplings for applications where it is critical for torque to be transmitted through a torsionally rigid connection without backlash while still being able to accommodate for shaft misalignment.

Additionally RINGSPANN can offer solutions where the torsional rigidity is beneficial for the application but needs to be adapted with the use of elastomers.

With Freewheels, Brakes, Shaft-Hub-Connections and Overload Clutches, RINGSPANN offers an exceptionally wide range of power transmission components that can be applied in drivetrains.

REK ... DCO

REK ... DCS

Features

- Compact design
- Small axial space required for installation
- Quick disassembly for minimal downtime
- Large allowable shaft tolerance of h8
- Shafts are not weakened by keyways
- No fretting corrosion like with keyway connections
- Typical applications: Drive units and conveyor drives e.g. in mining

Transmissible torques

The transmissible torques listed on the following page are subject to the listed tolerances, surface finishes and material requirements. Please contact RINGSPANN in case of deviations.

Tolerances

- h8 for shaft diameters d_F or d_M

Surfaces

Average surface finish at the contact surfaces of the shafts $R_z = 10 \dots 25 \mu\text{m}$.

Materials

RINGSPANN is able to recommend suitable shaft materials using DIN 743 (12/2012 edition) taking the surface pressures for the Tru-Line Flange-Couplings RFK ... TBO into account.

Simultaneous transmission of torque, axial force and bending moment

Where there are combinations of axial forces and/or bending moments in the application in addition to the torque T_N , the max. transmissible torque will be reduced as compared to the values for $T_{K \text{ max}}$ shown in the tables.

RINGSPANN will select the proper coupling for each application based upon the allowed transmissible torque under existing bending moment conditions. Our selection calculations are in accordance with the latest scientific knowledge and experience in the industry and will include the proper safety factor to prevent fretting corrosion. Please contact RINGSPANN.

Paired coupling halves of the same colour can be interchanged due to matching flange patterns. The maximum torques of the smaller coupling half apply.

* Number of connection screws Y in accordance DIN EN ISO 4014 property class 10.9 or 12.9 for RFK 0050 TBO on pitch circle T.

** for min. bore

Mounting

The installation and operating instruction for Tru-Line Flange-Couplings RFK ... TBO is available on request.

8-1

Features

- Compact design
- Easy to remove
- For shaft diameters ranging from 14 mm to 100 mm
- Rigid and backlash-free connections of the shaft ends
- Shafts are not weakened by keyways
- No fretting corrosion like with keyway connections
- Transmission of torque and/or axial forces
- Typical applications: Connection of shaft sections e.g. with slitter winders in the paper industry

RWK 0014 EEO-STA-0SE014

Transmissible torques and axial forces

The transmissible torques and axial forces listed on the following page are subject to the listed tolerances, surface finishes and material requirements. Please contact RINGSPANN in case of deviations.

Tolerances

- h8 for shaft diameter d

Surfaces

Average surface finish at the contact surfaces of the shafts $R_z = 10 \dots 25 \mu\text{m}$.

Materials

The following apply to the shafts:

- E-module $\geq 170 \text{ kN/mm}^2$

Simultaneous transmission of torque and axial force

The transmissible torques $T_{K \max}$ which are shown in the table apply for axial forces $F_{ax \max} = 0 \text{ kN}$ and conversely, the indicated axial forces $F_{ax \max}$ apply to torques $T_{K \max} = 0 \text{ Nm}$. If torque and axial force are to be transmitted simultaneously, the transmissible torque and the transmissible axial force are reduced.

For a given axial force $F_{AN \max}$, the reduced torque $T_{K \max r}$ is calculated as:

$$T_{K \max r} = \sqrt{T_{K \max}^2 - (F_{AN \max} \cdot \frac{d}{2})^2}$$

For a given torque $T_{N \max}$, the reduced axial force $F_{ax \max r}$ is calculated as:

$$F_{ax \max r} = \frac{2}{d} \sqrt{T_{K \max}^2 - T_{N \max}^2}$$

$T_{K \max}$	= Max. transmissible torque of the coupling [Nm]
$T_{K \max r}$	= Reduced maximum torque of the coupling [Nm]
$T_{N \max}$	= Maximum torque occurring in the application [Nm]

$F_{AN \max}$	= Maximum axial force occurring in the application [kN]
$F_{ax \max}$	= Max. transmissible axial force [kN]
$F_{ax \max r}$	= Reduced axial force [kN]
d	= Shaft diameter [mm]

Coupling size d mm	Max. transmissible torque or axial force		Clamping screws				D mm	B mm	L1 mm	L2 mm	Weight kg

Bending moments

Where there are bending moments in the application in addition to the torque $T_{N \max}$ or the axial force $F_{AN \max}$, the transmissible torque or transmissible axial force is reduced compared to the values for $T_{K \max}$ or $F_{ax \max}$ as listed in the table. Please contact RINGSPANN.

Mounting

The installation and operating instruction for Cone Clamping Coupling RWK ... EEO is available on request.

Gear Couplings RDZ ... DTO

torsionally rigid
double engagement gearing – lubricated

10-1

Features

- High nominal torques up to 391 500 Nm
- High misalignment capability
- Compensation of axial, radial and angular misalignments
- Double engagement allows smooth torque transmission
- Compact design due to inside turned hubs
- Complies with the AGMA standard (American Gear Manufacturer Association) up to coupling size 0090
- High power density
- Complies with ATEX 2014/34/EU
- Typical applications: Roll drives in the steel and paper industry, pumps, conveyors, fans and blowers

10-2

For finish bores, please specify bore diameter hub A and hub B. Tolerance of finish bores H7. Keyways in accordance with DIN 6885, sheet 1. Keyway tolerance JS9, different bore and keyway tolerances on request. Upon request, couplings larger than frame size 0100 also available.
* Bores also available in inch size, see page 73. ** Minimum necessary space to align the shafts.

Gear Couplings RDZ ... DFO

torsionally rigid
single engagement gearing – lubricated

12-1

12-2

Features

- High nominal torques up to 391 500 Nm
- Compensation of axial and angular misalignments
- Compact design due to inside turned hubs
- High power density
- Complies with ATEX 2014/34/EU
- Typical applications: Roll drives in the steel and paper industry, pumps, conveyors, fans and blowers

* Bores also available in inch size, see page 73. ** Minimum necessary space to align the shafts.

Gear Couplings RDZ ... EEO

torsionally rigid
continuous sleeve and double engagement gearing

14-1

Features

- Compensation of axial, radial and angular misalignments
- Double engagement allows smooth torque transmission
- Deployable in horizontal and vertical applications
- Temperature range from -25 °C to +100 °C
- Low weight and low moments of inertia
- Maintenance free thanks to a combination of steel and polyamide 6.6
- Typical applications: Hydraulics, pump drives

14-2

14-3

torsionally rigid
single disc pack

Features

- Nominal torques up to 18 700 Nm
- High torque capacity
- Backlash-free
- Compensation of axial and angular misalignments
- High torsional rigidity with low axial rigidity
- Temperature range -20 °C to +280 °C
- Maintenance free and long life with proper alignment
- Complies with ATEX 2014/34/EU
- Typical applications: Pumps, fans, packaging machines, paper machines, printing machines, conveyor systems, dynamometers, gantry systems

For finish bores, please specify bore diameter hub A and hub B. Tolerance of finish bores H7. Keyways in accordance with DIN 6885, sheet 1. Keyway tolerance JS9, different bore and keyway tolerances on request.

The weight refers to a combination of hub type 0 and hub type I with max. possible bore diameter respectively.

In deviation from figure 19-1, the combination of the hub type 0 / 0 is possible.

Upon request, also available with taper bushes.

Upon request, couplings larger than frame size 0160 also available.

For vertical installation, please contact RINGSPANN.

* Bores also available in inch size, see page 73.

** Distance M is required to tighten and loosen the screws for hub type I.

Disc Couplings RDL ... DSZ

torsionally rigid
double disc packs with spacer

Features

- Nominal torques up to 18 700 Nm
- High torque capacity
- Backlash-free
- Compensation of axial, radial and angular misalignments
- Double disc pack allows smooth torque transmission
- High torsional rigidity with low axial rigidity
- Temperature range -20 °C to +280 °C
- Maintenance free and long life with proper alignment
- Complies with ATEX 2014/34/EU
- Typical applications: Pumps, fans, packaging machines, paper machines, printing machines, mixers, dynamometers

For finish bores, please specify bore diameter hub A and hub B. Tolerance of finish bores H7. Keyways in accordance with DIN 6885, sheet 1. Keyway tolerance JS9, different bore and keyway tolerances on request. • The weight refers to the shortest standard DBSE L3.

Upon request: Varying DBSEs L3; Designs with taper bushes; Couplings larger than frame size 0160

In deviation from figure 21-1, a combination of the hubs of type 0 / 0 and type I / I is possible.

For vertical installation, please contact RINGSPANN.

* Bores also available in inch size, see page 73. • ** Distance M is required to tighten and loosen the screws for hub type I.

torsionally rigid
double disc packs, design according to API 610

Features

- Nominal torques up to 18 700 Nm
- High torque capacity
- Backlash-free
- Compensation of axial, radial and angular misalignments
- Double disc pack allows smooth torque transmission
- High torsional rigidity with low axial rigidity
- Temperature range -20 °C to +280 °C
- Complies with ATEX 2014/34/EU
- Typical applications: Centrifugal pumps, screw pumps, turbo compressors, rotary piston fans

Additional features

- No wear with optimal alignment, no lubrication necessary
- Corresponds to the provisions in accordance with API 610 and optionally, upon request, with the requirements in accordance with API 671

Hub with keyway

24-1

24-2

Features

- Compact design
- Simple robust design
- Electrical insulation
- No stick-slip effect
- Large radial shaft misalignment permissible
- Torsionally rigid
- Minimal restoring forces to adjacent machine parts
- Typical applications: Printing machines, machine tools

Tolerance of finish bores H7. Keyways in accordance with DIN 6885, sheet 1. Keyway tolerance P9.

* Max. angular displacement 3°.

** The hub length F can be shortened, which would change the dimensions A, C, K and L accordingly.

*** Arrangement of the fastening holes for screws Z (DIN EN ISO 4762) on pitch diameter T for coupling half with flange mounting.

Arrangement of the fastening holes

Hole pattern 1

Hole pattern 2

Hole pattern 3

Hole pattern 4

elastic
horizontally split cover

32-1

Features

- High nominal torques up to 335 500 Nm
- Compensation of axial, radial and angular misalignments
- Gradual increase in torsional rigidity as torques increase
- Horizontally split cover
- Easy replacement of the grid
- Typical applications: Crushers, reels, mills, calenders, mixers, belt drives

32-2

32-3

* Bores also available in inch size, see page 73.

** Minimum necessary space to align the shafts.

elastic
lubrication-free

Features

- Vertical/horizontal mounting
- Adsorbs vibrations
- Progressive torsion spring properties due to primarily pressurised bushings
- Fail-safe in the event of the failure of the bushings
- Easy replacement of bushings without disassembly of the coupling halves
- Maintenance free, no lubrication necessary
- Complies with ATEX 2014/34/EU
- Typical applications: Pump drives, belt drives, ventilators, general mechanical engineering

torsional elastic
with brake disc

40-1

Features

- Nominal torques up to 112 000 Nm
- Compensation of axial, radial and angular misalignments
- Coupling and brake disc matched to RINGSPANN brake systems
- Adsorbs vibrations
- Fail-safe in the event of the failure of the bushings
- Easy replacement of bushings without disassembly of the coupling halves
- Maintenance free, no lubrication necessary
- Typical applications: Belt drives, ventilators, general mechanical engineering

Jaw Couplings REK ... DGO

elastic for dynamic applications
with enclosed elastic elements

44-1

Features

- Compensation of axial, radial and angular misalignments
- Adsorbs vibrations
- Progressive torsion spring properties due to primarily pressurised elastic elements
- Fail-safe in the event of the failure of the elastic elements
- Maintenance free, no lubrication necessary
- Complies with ATEX 2014/34/EU
- Typical applications: Pump drives, ventilator drives, crane trolleys

44-2

For finish bores, please specify bore diameter hub A and hub B. Tolerance of finish bores H7. Keyways in accordance with DIN 6885, sheet 1. Keyway tolerance JS9.

For vertical installation, please contact RINGSPANN.

See following pages for performance data.

* Bores also available in inch size, see page 73.

Jaw Couplings REK ... DHO

elastic for dynamic applications
with enclosed elastic elements and two piece hub

Features

- Compensation of axial, radial and angular misalignments
- Adsorbs vibrations
- Progressive torsion spring properties due to primarily pressurised elastic elements
- Fail-safe in the event of the failure of the elastic elements
- Easy replacement of elastic elements without disassembly of the coupling halves
- Maintenance free, no lubrication necessary
- Elastic elements can be replaced without moving the drive
- Complies with ATEX 2014/34/EU
- Typical applications: Pump drives, ventilator drives, crane trolleys

Jaw Couplings REK ... DCO

elastic for dynamic applications
with curved jaws

Features

- Compensation of axial, radial and angular misalignments
- Adsorbs vibrations
- Symmetrical design allows for high running speeds without additional balancing
- Fail-safe in the event of the failure of the spider
- Maintenance free, no lubrication necessary
- Complies with ATEX 2014/34/EU
- Typical applications: Pump drives, ventilator drives, crane trolleys, machine tools, conveyor belts

For finish bores, please specify bore diameter hub A and hub B. Tolerance of finish bores H7. Keyways in accordance with DIN 6885, sheet 1. Keyway tolerance JS9. See following pages for weights, moments of inertia and performance data.
* Bores also available in inch size, see page 73.

During selection, the nominal torque of the coupling at +30 °C was factored in with a start-up factor S₂ of 1 and a co-efficient of impact S_A/S_L of 1. Detailed selection in accordance with the technical information on page 70 et seq.

Jaw Couplings REK ... DCS

elastic for dynamic applications
with curved jaws and brake disc

64-1

Features

- Compensation of axial, radial and angular misalignments
- Coupling and brake discs matched to RINGSPANN brake systems
- Adsorbs vibrations
- Fail-safe in the event of the failure of the spider
- Maintenance free, no lubrication necessary
- Blind assembly possible
- Symmetrical design allows for high running speeds without additional balancing
- Typical application: Ventilator drives, crane trolleys, machine tools, conveyor belts

64-2

Order example

Coupling selection

The selection of the coupling is carried out in accordance with DIN 740 part 2 or with the help of service factors due to experience (see table: Assignment of the selection method to coupling types). The coupling must be designed in such a manner that the permissible coupling

stress is not exceeded in any operating state. A comparison of the occurring stresses with the permissible coupling parameters must be carried out for this purpose.

In addition to the selection of the coupling, the load-bearing capacity of the selected Shaft-Hub-Connection must be examined by the customer.

Formula symbols

J_A = Moment of inertia of the drive side [kgm²]

J_L = Moment of inertia of the load side [kgm²]

M_A = Rotational inertia factor of the drive side

M_L = Rotational inertia factor of the load side

N = Speed of the machine [min⁻¹]

P_{AN} = Nominal power of the drive [kW]

P_{LN} = Power consumption of driven machine [kW]

P_N = Nominal power $P_N = P_{AN}$ or P_{LN} [kW]

S_{A, S_L} = Co-efficient of impact

S_B = Service factor

S_t = Temperature factor

S_Z = Start-up factor

T_{AS} = Peak torque of the drive side [Nm]

T_{Kmax} = Maximum permissible torque of the coupling [Nm]

T_{KN} = Nominal torque of the coupling [Nm]

T_{kW} = Alternating torque of the coupling [Nm]

T_{LS} = Peak torque of the load side [Nm]

T_N = Nominal torque of the machine [Nm]

T_S = Peak torque of the machine [Nm]

T_W = Alternating torque of the machine [Nm]

Design as per DIN 740 part 2

a) Drives without periodic stress due to torsional vibration

For drives without periodic stress due to torsional vibration such as centrifugal pumps, ventilators, screw compressors and similar applications, the nominal torque of the machine T_N may not exceed the nominal torque of coupling T_{KN} .

1. Stress from the nominal torque of the machine

The nominal torque of the machine T_N results from:

$$T_N = 9550 \cdot \frac{P_N}{n}$$

With consideration of the temperature factor S_t , the nominal torque of coupling T_{KN} must be at least as high as the nominal torque of machine T_N .

$$T_{KN} \geq T_N \cdot S_t$$

2. Additional stress through torque shocks

If shock loads occur often in the machine, the additional peak torque T_S and the shock frequency S_Z must be factored in.

Depending on the shock type, the shock direction and the mass distribution, the peak torque T_S can be calculated as follows:

Drive-side shock:

$$T_S = T_{AS} \cdot M_A \cdot S_A$$

Load-side shock:

$$T_S = T_{LS} \cdot M_L \cdot S_L$$

with

$$M_A = \frac{J_L}{J_A + J_L} \quad M_L = \frac{J_A}{J_A + J_L}$$

The maximum permissible torque of coupling $T_{K \max}$ must be larger than the sum of peak torque T_S multiplied by the start-up factor S_Z and the nominal torque of the machine T_N with consideration of the temperature factor S_t .

$$T_{K \max} \geq T_S \cdot S_Z \cdot S_t + T_N \cdot S_t$$

For drives with A.C. motors and large, load-side masses, the start-up peak torque should be calculated with the help of suitable simulation methods.

b) Drives with periodic stress due to torsional vibration

Drives where torsional vibration can occur (e.g. diesel motors, piston compressors, piston pumps, etc.), the torques seen by the coupling can be determined through a rotational vibration analysis of the entire system. This requires among other things knowledge of the rotating masses, the rotational rigidity and all the excitation movements that occur in the system. In many cases, a vibrational calculation is too time consuming or you may not have all the necessary data in the configuration phase available. In this case, an approximate design can be carried out on the basis of the following criteria:

1. Stress through the unit torque

Using the temperature factor S_t , the nominal torque of the coupling T_{KN} must be at least as high as the nominal torque of the machine T_N .

$$T_{KN} \geq T_N \cdot S_t$$

2. Stress through an alternating torque

The periodic alternating torque of the machine T_W may at operating speed and using the temperature factor S_t may not exceed the permissible alternating torque of the coupling T_{KW} .

$$T_{KW} \geq T_W \cdot S_t$$

3. Stress when passing through harmonic resonance

If the harmonic resonance is passed through during operation, the hereby occurring peak torque T_S with consideration of the ambient temperature S_t may not exceed the maximum permissible torque of coupling $T_{K \max}$.

$$T_{K \max} \geq T_S \cdot S_t$$

Design with service factors

The permissible nominal torque of coupling T_{KN} must be at least as high as the nominal torque of the machine T_N with consideration of the operating conditions (service factor S_B).

$$T_{KN} \geq T_N \cdot S_B$$

The nominal torque of the machine T_N results is determined as follows

$$T_N = 9550 \cdot \frac{P_N}{n}$$

n = Speed of the machine [min^{-1}]

P_N = Nominal power [kW]

T_{KN} = Nominal torque of the coupling [Nm]

T_N = Nominal torque of the machine [Nm]

Inch bores

The RINGSPANN shaft couplings are also available with bores in inch dimensions.

RINGSPANN follows the specifications of AGMA 9002-C14 as of 02.2015. Deviating bores, e.g. according to B.S. 46, are possible, but must be requested separately. When ordering inch bores, RINGSPANN recommends specifying not only the bore diameter in inches or millimetres, but also the width and depth of the keyway and the desired fit.

On the next page you will find a selection of the most common bores with the dimensions of the keyways. Further bores can be requested from RINGSPANN.

Inch bores

	Date:

1. Type of application

1.1 Machine type, machine group or drive:

2. Operating data

2.1 Performance data

Driving power	P_n	_____	[kW]
Max. shaft speed	n_M	_____	[min ⁻¹]
Nominal torque	M_N	_____	[Nm]
Max. torque	M_{max}	_____	[Nm]
Min. safety factor	S_{min}	_____	[1]
Max. bending moment	M_b	_____	[Nm]
Max. radial force	F_{rad}	_____	[N]
Max. axial force	F_{ax}	_____	[N]

2.2 Installation conditions

outside
 in a closed room

Ambient temperatures
 from _____ °C to _____ °C

2.3 Supplement

Please send us a description and drawing in the event of other installation conditions. We are happy to review them and provide recommendations.

3. Dimensions

3.1 Data of shaft

Shaft 1/Flange 1

Shaft diameter	d_1	_____	[mm]
Shaft material		_____	
Shaft tolerance	T_{1W}	_____	[mm]
Average surface roughness	R_{z1}	_____	[µm]

Shaft 2/Flange 2

Shaft diameter	d_2	_____	[mm]
Shaft material		_____	
Shaft tolerance	T_{2W}	_____	[mm]
Average surface roughness	R_{z2}	_____	[µm]

Drawing of the coupling with dimensions of the shaft ends
